

Where PUDA stands, and what comes next

October 2026 · Confidential · For [Investor name]

Dear [Investor name],

Here is a short update on PUDA: the decisions we have taken, the work done this month, what is not proven yet and the next steps. The full investor presentation is attached.

1. Decisions taken

- **Launch in two phases.** Phase 1: a smart contract audit by a single recognised firm (CertiK, Hacken or SolidProof), a private presale to initial investors with KYC, and marketing to reach them. These are the only upfront costs. Phase 2, paid at launch with the funds raised: the company in El Salvador (S.A. de C.V.), UIF and CNAD issuer registration, the offering document (DIR) with an independent certifier, and the public offering through licensed providers.
- **The reserve backing PUDA is never put at risk.** It stays in custody, off the exchange. The trading system can lose at most the reserve's annual yield (about 4%, depending on interest rates). A global annual cap in the trading software enforces it: once reached, every agent stops until the next year. PUDA's market price can fall; the backing of each token cannot.
- **Trading system: eleven agents, one per subaccount.** \$1M per subaccount, at most 20% at play, deployed in tranches from \$50,000 per agent and increased only after profitable months. 3x leverage; trades of at most 48 hours for the fast agents; a pause at -10% and a permanent stop at -20% per subaccount. Five agents start with real money, five run on demo until they prove themselves (90 days, profitable, drawdown of 10% or less) and one waits for an exchange API.

2. Work done

- The trading software was reviewed end to end and its risk controls completed: mandatory stop losses, isolated margin, capital cap and ramp, per-agent modes and limits, demo-to-real graduation and the global annual loss cap. All covered by 90 automated tests.
- A 3-year stress test on simulated extreme markets: a full cycle with one-day crashes like LUNA and FTX, a 3-year bear market (BTC down 55-95%) and a sideways market, 9 paths in total.

-6.7%

worst combined
drawdown (8
subaccounts)

-3.4%

worst combined month

-0.4%

combined, in BTC's worst
months (BTC -34%)

1 of 36

simulated years in which
the 4% cap would trigger

- The website was cleaned up (nothing is sold before registration) and an interest list was added.
- The investor presentation, in English and Spanish, is ready (attached).

3. What is not proven yet

The stress test measures risk on simulated markets; it does not predict returns. Our 3–5% monthly target on the capital at play is an internal management goal, not a promise. It will be validated with a backtest on real exchange history (2020–2026, including the 2021 bull run, the 2022 crash and the recovery) and 3–6 months on Bitget's demo environment before any real money is used.

4. Next steps

STEP	WHAT
Audit firm	Quotes from CertiK, Hacken and SolidProof; we choose one.
Marketing	Plan and budget to reach the initial investors.
Legal	Salvadoran lawyer to confirm the private presale route under the LEAD and the rules for a backed token.
Real backtest	The trading system on six years of real price history.
Demo	The eleven agents on Bitget Demo with the final configuration.
Partners	Shareholders' agreement: capital, split and vesting.

5. What we would value from you

- Your view on the presale size and on the audit firm.
- Introductions to potential initial investors, where appropriate.
- [Any other item to agree with you: role, contribution, timing.]

Best regards,

[Your name]

[Company / contact]

Attachment: PUDA · Investor presentation (PDF). This document is informational. It is not an offer of securities or an investment recommendation. The presale is private and subject to legal confirmation in El Salvador; any public sale will take place only after CNAD registration.
